

David Adeyemo

Nested If Assignment Problems. Do the IPO and code for each of the problems below.

1) The student will enter their last name and score. Determine their letter grade using the scale below. Display the student's last name and letter of grade.

Score Letter Grade

90 & up A

80 to 89 B

70 to 79 C

60 to 69 D

Below 60 F

Input	Process	Output
stlname	<pre>if (score > 90) { letter = 'A' } else if (score >= 80) { letter = 'B' } else if (score >= 70) { letter = 'C' } else if (score >= 60) { letter = 'D' } else { letter = 'F' }</pre>	
Score		Student Last Name:
Letter		Score:
		Letter grade:

2) You are buying apples in bulk. Enter the quantity in pounds, determine the price per pound, then display the price per pound and total.

LBS Price Per Pound

>100 .10

50-100 .25

Under 50 .50

Input	Process	Output
Quantity (lbs)	<pre> If (quantity > 100) { price per pound = 0.10; } else if (quantity >= 50) { price per pound = 0.25; } else { price per pound = 0.50 } </pre>	
Priceperpound		
Total	Total = quantity * price per pound	Price Per Pound:
		Total:

3) Enter the employee last name, hours worked and job code. Compute the pay based on the hourly rate per the job code. Display employee last name, hours worked, pay rate and total.

Job Code Pay Rate

E 25.00

J 20.00

A 15.00

Input	Process	Output
Char jobCode	<pre> If (jobcode == "E" jobcode == 'e') { prate = 25.00}; } else if (jobcode == "J" jobcode == 'j') { prate = 20.00 } else if (jobcode == "A" jobcode == 'a') { prate = 15.00 } else Cout << "Invalid Job Code" << endl; </pre>	

E_Iname	Tpay = hrs * prate	
Hrs	Display : e_name , hours worked, and job code	Last Name:
Prate		Hours Worked:
tpay		Job Code:
		Total amount paid:

4) Allow the user to enter the annual salary. Determine the tax rate from the table below. Compute the tax amount owed. Display salary, tax rate and tax amount.

Salary Tax Rate

>100,000 40%

50,000 - 100,000 35%

Under 50,000 25%

Input	Process	Output
asalary	If (asalary > 100000) { trate = .40 }Else if { asalary >= 50000) { trate = .35 } else (50000 > asalary) { trate = .25)	
trate	Owing = asalary * trate	Salary:
Owing		Tax Rate:
	Display salary, tax rate, tax amount owed .4.	Tax Amount Owed:

5) You are running a metal recycling center and must pay people for the metals they bring in. You give them a rate based on the weight in the table below. Allow the user to enter the weight. Determine the rate and then display the weight, rate, and total given to the customer.

Weight Rate Per Pound

>100 .50

30-100 .25
 20- less 30 .20
 Less 20 .10

Input	Process	Output
Weight	<pre> If (weight> .50) { rate = 0.50 Else if (weight >= 30) {rate = 0.25} Else if (weight >= 20) {rate = .20} Else {rate = .10} } </pre>	
Rate	Total = weight * rate	Weight
Total	Display weight, rate, total	Rate
		Total
